

The Standalone Servo Compression upgrade utilizes two standalone servo amps that can communicate with any PLC. This allows us to install this upgrade without the added cost of a servo controller. The servo driven linear actuators are designed to offer a much longer life expectancy than a standard air cylinder.

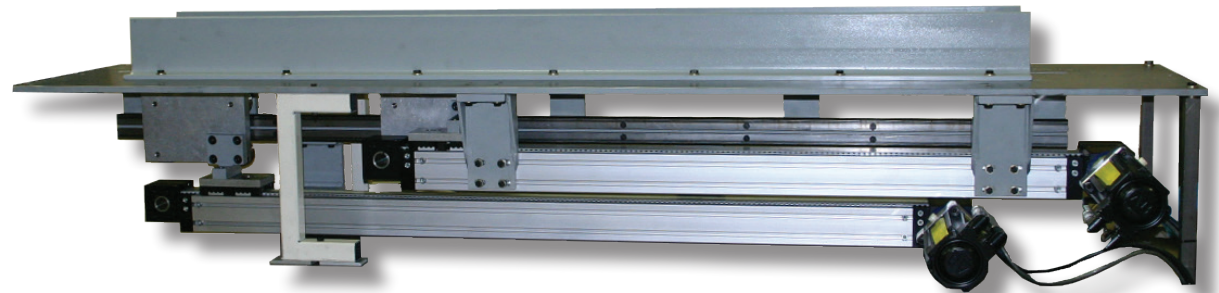

The advantages of this upgrade include reduced maintenance, programmable pack size changes, and because it does not use compressed air, reduced operating costs.

Includes:

- Standalone servo amps
- Servo motors
- Linear actuators and mounts
- Required mounting hardware for carriages

Please contact your Bretting Manufacturing representative to discuss your upgrade needs.

Standalone Servo Compression Upgrade
